1 Introduction

Aim for a report of about three pages including figures, with a maximum of five pages. For each question, show your work, and explain your choices where necessary: writing quality and clarity as well as mathematical rigor affect grading substantially. As much as conciseness permits, demonstrate you understand what is going on.

About using results from the lecture notes: You may (and should) use results from the course without proving them, but you must cite them by number (e.g., “Theorem 4.28 of the lecture notes”) and check that their assumptions hold in your setting. An uncited or unchecked invocation is not worth full credit, even when the conclusion is right.
